

Ser. No. 10/625,997

Amendments to the Claims

1. (Currently amended) A turbine engine nozzle subassembly comprising:
an upstream flap;
a downstream flap pivotally coupled to the upstream flap for relative rotation about a hinge axis; and
an actuator linkage coupled to the downstream flap along a forward half thereof for actuating the upstream and downstream flaps between a plurality of throat area conditions while permitting aerodynamically-induced orientation changes of the downstream flap.
2. (Original) The subassembly of claim 1 further comprising:
an external flap pivotally coupled to the downstream flap and to an environmental structure so that a span between respective coupling locations with said downstream flap and environmental structure is extensible and contractable responsive to aerodynamic forces; and
means for restricting an extensibility range of said external flap.
3. (Currently amended) The subassembly of claim 2 wherein:
said means for restricting comprises a secondary link having a first pivotal coupling location to the environmental structure and a second pivotal coupling location to the ~~divergent downstream~~ flap, the second pivotal coupling location being intermediate the coupling location of the downstream flap to the external flap and a coupling location of the actuator linkage to the downstream flap; and
the secondary link has a restricted free float range relative to the downstream flap.
4. (Currently amended) A turbine engine nozzle comprising:
a static structure;
a plurality of flap subassemblies comprising:
an upstream flap pivotally coupled to the static structure for relative rotation about an axis essentially fixed relative to the static structure; and
a downstream flap pivotally coupled to the upstream flap for relative rotation

Ser. No. 10/625,997

about a hinge axis permitting aerodynamically-induced mode changes of the downstream flap; and

means for actuating articulation of the upstream and downstream flaps of the plurality of flap subassemblies within a range of areas of ~~the~~ a throat along the downstream flap while minimizing ~~mode-induced~~ changes in throat area at a given design point induced by said mode changes.

5. (Original) The nozzle of claim 4 wherein:

the plurality of flap subassemblies are axisymmetrically arranged about an engine centerline;

said articulation is simultaneous for each of the flap subassemblies; and

each of the plurality of flap subassemblies further comprises an external flap pivotally coupled to the downstream flap.

6. (Withdrawn) A method for retrofitting a turbine engine or reengineering a turbine engine configuration which engine or configuration has or has previously had a first nozzle subassembly having a convergent flap, a divergent flap, an external flap, and an actuation linkage coupled to the convergent flap, the method comprising:

installing or engineering a second subassembly comprising:

a second convergent flap;

a second divergent flap; and

a second actuation linkage, optionally sharing one or more components with the actuation linkage of the first nozzle subassembly, and coupled to the second divergent flap so as to permit an aerodynamically-induced mode change articulation of the second divergent flap to rotate the second divergent flap about a non-fixed instantaneous center of rotation while simultaneously rotating the second divergent flap relative to the second convergent flap about a non-fixed hinge axis.

7. (Withdrawn) The method of claim 6 wherein:

said second subassembly provides an aerodynamic throat having a throat area that is less

Ser. No. 10/625,997

sensitive to area changes associated with said mode change articulation than was an area of a throat provided by the first nozzle subassembly.

8. (Withdrawn) The method of claim 6 wherein:
a circumferential array of such first nozzle subassemblies are replaced with a circumferential array of such second nozzle subassemblies.
9. (New) The subassembly of claim 1 wherein:
said throat is formed along a longitudinally convex surface portion of the downstream flap.
10. (New) The subassembly of claim 1 wherein:
said throat is formed downstream of a hinge axis coupling the upstream flap to the downstream flap.
11. (New) A nozzle comprising:
a circumferential array of subassemblies of claim 1; and
a synchronization ring mounted for longitudinal translation between first and second positions and coupled to said linkage of each of the subassemblies so that said translation causes said actuating.
12. (New) The nozzle of claim 11 wherein:
the linkage of each of the subassemblies comprises a bell crank and a transfer link coupling the bell crank to the downstream flap.
13. (New) The nozzle of claim 4 wherein:
said throat is formed along a longitudinally convex surface portion of the downstream flap.
14. (New) A turbine engine nozzle subassembly comprising:

Ser. No. 10/625,997

an upstream flap;

a downstream flap pivotally coupled to the upstream flap for relative rotation about a hinge axis; and

an actuator linkage coupled to the downstream flap along a forward half thereof for actuating the upstream and downstream flaps between a plurality of throat area conditions, said throat being formed along a longitudinally convex surface portion of the downstream flap.

15. (New) The subassembly of claim 14 wherein:

said throat is formed downstream of a hinge axis coupling the upstream flap to the downstream flap.

16. (New) A turbine engine nozzle subassembly comprising:

an upstream flap;

a downstream flap pivotally coupled to the upstream flap for relative rotation about a hinge axis; and

an actuator linkage coupled to the downstream flap along a forward half thereof for actuating the upstream and downstream flaps between a plurality of throat area conditions and comprising a bell crank and a transfer link coupling the bell crank to the downstream flap.

17. (New) The subassembly of claim 16 wherein:

said throat is formed downstream of a hinge axis coupling the upstream flap to the downstream flap.

18. (New) The subassembly of claim 16 wherein:

the linkage permits aerodynamically-induced orientation changes of the downstream flap.

19. (New) A turbine engine nozzle subassembly comprising:

a convergent flap;

a divergent flap; and

an actuation linkage, coupled to the divergent flap so as to permit an

Ser. No. 10/625,997

aerodynamically-induced mode change articulation of the divergent flap to rotate the second divergent flap about a non-fixed instantaneous center of rotation while simultaneously rotating the divergent flap relative to the convergent flap about a non-fixed hinge axis.

20. (New) The subassembly of claim 19 wherein:

a nozzle throat is formed downstream of a hinge axis coupling the convergent flap to the divergent flap.
